

DATABASE

1 DATABASE ‘Terapia Intensiva’

1.1 Introduzione

Questa relazione descrive il lavoro svolto nell’ambito di un’attività di esercitazione relativa alla realizzazione di un database nel contesto sanitario. L’obiettivo principale era sviluppare un sistema per la gestione dei segni vitali raccolti al letto del paziente nel reparto di Terapia Intensiva.

Nel reparto di Terapia Intensiva, i segni vitali vengono registrati automaticamente ad intervalli di tempo regolare da un sistema di dispositivi presenti al letto del paziente. I parametri che vengono registrati includono la pressione (sistolica e diastolica), la temperatura, il polso, la frequenza respiratoria e l’elettroencefalogramma (EEG).

I medici del reparto necessitano di un sistema che consenta loro di visualizzare l’andamento dei segni vitali dei pazienti nel corso della giornata al fine di monitorarne lo stato di salute e prendere decisioni cliniche informate.

Nel contesto di questa esercitazione sono stati affrontati i seguenti compiti:

1. Definizione del modello concettuale (diagramma E-R) e logico del database necessario per la gestione dei segni vitali nel reparto di Terapia Intensiva.
2. Popolamento del database con i valori di un giorno di circa 5 pazienti, utilizzando valori esemplificativi. Per l’EEG, sono state utilizzate tracce open source.
3. Scrittura di query SQL per ottenere le seguenti informazioni:
 - La media della temperatura, del polso e della frequenza respiratoria dei pazienti nel corso della giornata.
 - Il minimo e il massimo della pressione registrata nel corso della giornata per ciascun paziente.
 - Individuazione dei pazienti che hanno avuto picchi di temperatura ($T > 39.5$ gradi) e di pressione ($p_{Sistolica} > 175$ mmHg).
4. Sviluppo di un programma in Python che, collegandosi al database, consenta a un medico del reparto di visualizzare l’andamento giornaliero dei parametri di pressione, temperatura, polso e frequenza respiratoria di un paziente ricoverato, nonché la traccia EEG di un paziente rilevata in una certa fascia oraria.

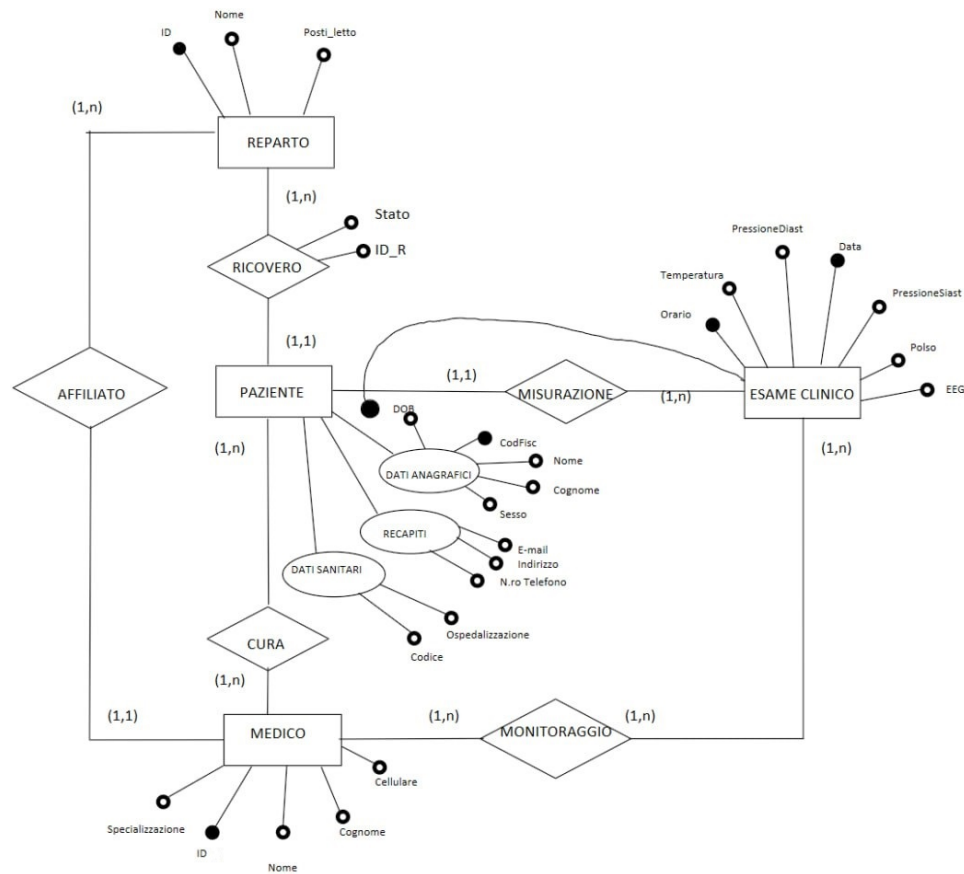

La relazione include la descrizione dettagliata delle modalità di svolgimento dell’esercizio, il modello del database, le query SQL utilizzate, i risultati ottenuti sotto forma di tabelle, la descrizione dell’architettura del programma Python e degli esempi dei grafici ottenuti.

Inoltre, sono forniti anche il database popolato con i dati di esempio e il programma Python sviluppato per la visualizzazione dei segni vitali.

Il presente lavoro si propone di fornire una soluzione completa e funzionale per la gestione dei segni vitali nel reparto di Terapia Intensiva, offrendo ai medici gli strumenti necessari per monitorare l'andamento dei parametri vitali dei pazienti e supportare la presa di decisioni cliniche basate su dati accurati e affidabili.

1.2 Diagramma E-R

Fig. 1.2 Diagramma E-R

1.3 Modello Relazionale

Esami Clinici (*Orario*, Pressione arteriosa, Pressione diastolica, Pressione sistolica, Temperatura, Polso, Frequenza Respiratoria, *Paziente*, *Data*)

Pazienti (DOB, *CodFisc*, Nome, Cognome, Sesso, E-mail, Indirizzo, N°tel, Ospedalizzazione, Codice)

Medici (*ID*, Nome, Cognome, Specializzazione, Cell, Reparto)

Reparti (Nome, PostiLetto, *ID*)

Ricoveri (*Paziente*, Stato, ID_R, Reparto)

Monitoraggi (*CodFiscPaz*, *Medico*, *OrarioEs*, *Data*)

Cure (*Paziente*, *Medico*)

1.4 SQLAlchemy

SQLAlchemy è una libreria Python che fornisce un'astrazione potente e flessibile per lavorare con database relazionali. È progettata per semplificare la comunicazione e la gestione dei dati tra un'applicazione Python e un database.

Con SQLAlchemy, è possibile creare, modificare, interrogare e gestire database utilizzando un approccio orientato agli oggetti, in cui le tabelle del database vengono rappresentate come classi Python e le righe delle tabelle come istanze di queste classi.

Per prima cosa installiamo i package necessari all'inserimento dei dati

```
[16]: !pip install sqlalchemy
      !pip install mysql-python
```

```
Requirement already satisfied: sqlalchemy in
c:\users\utente\appdata\local\programs\python\python310\lib\site-packages
(2.0.16)
Requirement already satisfied: greenlet!=0.4.17 in
c:\users\utente\appdata\local\programs\python\python310\lib\site-packages (from
sqlalchemy) (2.0.2)
Requirement already satisfied: typing-extensions>=4.2.0 in
c:\users\utente\appdata\local\programs\python\python310\lib\site-packages (from
sqlalchemy) (4.3.0)

WARNING: You are using pip version 21.2.4; however, version 23.1.2 is available.
You should consider upgrading via the
'C:\Users\Utente\AppData\Local\Programs\Python\Python310\python.exe -m pip
install --upgrade pip' command.

```

1.5 Dataset: VitalDB

1.5.1 Introduzione al dataset

Il dataset VitalDB disponibile al link (<https://vitaldb.net/dataset/?query=overview>) è una collezione di dati medici in tempo reale provenienti da pazienti ricoverati in terapia intensiva. Il dataset contiene una vasta gamma di informazioni cliniche, tra cui parametri vitali, segnali fisiologici, esami di laboratorio e altre misurazioni.

Le principali caratteristiche e informazioni sul dataset VitalDB sono le seguenti:

I dati del dataset sono raccolti da pazienti ricoverati in terapia intensiva in diversi ospedali e strutture sanitarie. Il dataset comprende una serie di parametri vitali, come pressione arteriosa, temperatura corporea, frequenza cardiaca, frequenza respiratoria e altri indicatori importanti per il monitoraggio dello stato clinico dei pazienti. Oltre ai parametri vitali, il dataset include anche segnali fisiologici registrati, come l'elettrocardiogramma (ECG) e l'elettroencefalogramma (EEG). Questi segnali forniscono informazioni dettagliate sulle attività cardiache e cerebrali dei pazienti.

I dati del dataset sono registrati nel tempo, consentendo l'analisi dell'andamento e delle variazioni dei parametri vitali e dei segnali fisiologici nel corso del tempo. Ciò può essere utile per identificare pattern, tendenze o eventi critici che possono influenzare la condizione del paziente. Il dataset VitalDB è disponibile in formato tabellare o in altri formati standard come CSV o SQL. Ciò facilita l'importazione e l'analisi dei dati utilizzando strumenti di analisi come Python e librerie come Pandas. Il dataset VitalDB, inoltre, è ampiamente utilizzato per scopi di ricerca e sviluppo nell'ambito della medicina, dell'informatica sanitaria e dell'apprendimento automatico. I dati possono essere utilizzati per sviluppare algoritmi di monitoraggio, modelli di previsione e sistemi di supporto alle decisioni cliniche. In generale, il dataset VitalDB rappresenta una preziosa risorsa per la ricerca e l'analisi nell'ambito della medicina e dell'informatica sanitaria. L'accesso a un'ampia gamma di dati clinici in tempo reale può contribuire alla comprensione delle dinamiche dei parametri vitali, alla valutazione dell'efficacia dei trattamenti e alla progettazione di soluzioni innovative per il monitoraggio e la gestione dei pazienti.

Il dataset contiene i dati raccolti da pazienti sottoposti a interventi chirurgici non cardiaci (ad esempio chirurgia generale, toracica, urologica e ginecologica) presso 10 delle 31 sale operatorie

dell'Ospedale Universitario Nazionale di Seoul, situato a Seoul, nella Repubblica di Corea. I dati sono stati registrati utilizzando il software Vital Recorder versione 1.7.4 e sono disponibili in formato di file "vital". Ogni file di caso contiene dati ad alta risoluzione con una frequenza di campionamento di 500 Hz per i dati a forma d'onda e da 1 a 7 secondi per i dati numerici. In media, ogni caso contiene circa 2,8 milioni di punti dati. Il dataset comprende un totale di 557.622 tracce di dati provenienti da 6.388 casi diversi. La quantità di tracce di dati per caso varia da un minimo di 16 a un massimo di 136, con una media di 87 tracce per caso. Tutte le tracce di dati presenti nei file "vital" sono state estratte, convertite nel formato CSV e compresse utilizzando il formato gzip.

1.5.2 Utilizzo del dataset

Caricamento della libreria e dei dati Per utilizzare il set di dati aperti VitalDB, è necessaria la libreria pandas. Per prima cosa, dobbiamo caricare 2 endpoint del dataset aperto VitalDB.

```
[23]: import pandas as pd

df_cases = pd.read_csv("https://api.vitaldb.net/cases") # clinical information
df_trks = pd.read_csv("https://api.vitaldb.net/trks") # track list
```

Utilizzo dei dati clinici openpyxl è una libreria Python per leggere/scrivere i file xlsx/xlsm/xltx/xltn di Excel.

```
[24]: pip install openpyxl
```

```
Requirement already satisfied: openpyxl in
c:\users\utente\appdata\local\programs\python\python310\lib\site-packages
(3.1.2)
Requirement already satisfied: et-xmlfile in
c:\users\utente\appdata\local\programs\python\python310\lib\site-packages (from
openpyxl) (1.1.0)
Note: you may need to restart the kernel to use updated packages.

WARNING: You are using pip version 21.2.4; however, version 23.1.2 is available.
You should consider upgrading via the
'C:\Users\Utente\AppData\Local\Programs\Python\Python310\python.exe -m pip
install --upgrade pip' command.
```

Si controllano visivamente i casi e le variabili del dataset VitalDB.

```
[25]: df_cases
```

```

WARNING: You are using pip version 21.2.4; however, version 23.1.2 is available.
You should consider upgrading via the
'C:\Users\Utente\AppData\Local\Programs\Python\Python310\python.exe -m pip
install --upgrade pip' command.

This application is used to convert notebook files (*.ipynb)
to various other formats.

WARNING: THE COMMANDLINE INTERFACE MAY CHANGE IN FUTURE RELEASES.

Options

=====

The options below are convenience aliases to configurable class-options,
as listed in the "Equivalent to" description-line of the aliases.

To see all configurable class-options for some <cmd>, use:

```
<cmd> --help-all
```

--debug

set log level to logging.DEBUG (maximize logging output)

Equivalent to: [--Application.log_level=10]

--show-config

Show the application's configuration (human-readable format)

Equivalent to: [--Application.show_config=True]

--show-config-json

Show the application's configuration (json format)

Equivalent to: [--Application.show_config_json=True]

--generate-config

generate default config file

Equivalent to: [--JupyterApp.generate_config=True]

-y

Answer yes to any questions instead of prompting.

Equivalent to: [--JupyterApp.answer_yes=True]

--execute

Execute the notebook prior to export.

Equivalent to: [--ExecutePreprocessor.enabled=True]

--allow-errors

Continue notebook execution even if one of the cells throws an error and include the error message in the cell output (the default behaviour is to abort conversion). This flag is only relevant if '--execute' was specified, too.

Equivalent to: [--ExecutePreprocessor.allow_errors=True]

--stdin

read a single notebook file from stdin. Write the resulting notebook with default basename 'notebook.*'

Equivalent to: [--NbConvertApp.from_stdin=True]

--stdout

Write notebook output to stdout instead of files.

Equivalent to: [--NbConvertApp.writer_class=StdoutWriter]

--inplace

Run nbconvert in place, overwriting the existing notebook (only relevant when converting to notebook format)

Equivalent to: [--NbConvertApp.use_output_suffix=False
--NbConvertApp.export_format=notebook --FilesWriter.build_directory=]

--clear-output

Clear output of current file and save in place, overwriting the existing notebook.

Equivalent to: [--NbConvertApp.use_output_suffix=False
--NbConvertApp.export_format=notebook --FilesWriter.build_directory=
--ClearOutputPreprocessor.enabled=True]

--no-prompt

Exclude input and output prompts from converted document.

Equivalent to: [--TemplateExporter.exclude_input_prompt=True
--TemplateExporter.exclude_output_prompt=True]

--no-input

Exclude input cells and output prompts from converted document. This mode is ideal for generating code-free reports.

Equivalent to: [--TemplateExporter.exclude_output_prompt=True
--TemplateExporter.exclude_input=True
--TemplateExporter.exclude_input_prompt=True]

--allow-chromium-download

Whether to allow downloading chromium if no suitable version is found on the system.

Equivalent to: [--WebPDFExporter.allow_chromium_download=True]

--disable-chromium-sandbox

Disable chromium security sandbox when converting to PDF..

Equivalent to: [--WebPDFExporter.disable_sandbox=True]

--show-input

Shows code input. This flag is only useful for dejavu users.

Equivalent to: [--TemplateExporter.exclude_input=False]

--embed-images

Embed the images as base64 dataurls in the output. This flag is only useful for the HTML/WebPDF/Slides exports.

Equivalent to: [--HTMLExporter.embed_images=True]

```

--sanitize-html
    Whether the HTML in Markdown cells and cell outputs should be sanitized..
    Equivalent to: [--HTMLExporter.sanitize_html=True]
--log-level=<Enum>
    Set the log level by value or name.
    Choices: any of [0, 10, 20, 30, 40, 50, 'DEBUG', 'INFO', 'WARN', 'ERROR',
'CRITICAL']
    Default: 30
    Equivalent to: [--Application.log_level]
--config=<Unicode>
    Full path of a config file.
    Default: ''
    Equivalent to: [--JupyterApp.config_file]
--to=<Unicode>
    The export format to be used, either one of the built-in formats
    ['asciidoc', 'custom', 'html', 'latex', 'markdown', 'notebook',
'pdf', 'python', 'qtpdf', 'qtpng', 'rst', 'script', 'slides', 'webpdf']
    or a dotted object name that represents the import path for an
    ``Exporter`` class
    Default: ''
    Equivalent to: [--NbConvertApp.export_format]
--template=<Unicode>
    Name of the template to use
    Default: ''
    Equivalent to: [--TemplateExporter.template_name]
--template-file=<Unicode>
    Name of the template file to use
    Default: None
    Equivalent to: [--TemplateExporter.template_file]
--theme=<Unicode>
    Template specific theme(e.g. the name of a JupyterLab CSS theme distributed
    as prebuilt extension for the lab template)
    Default: 'light'
    Equivalent to: [--HTMLExporter.theme]
--sanitize_html=<Bool>
    Whether the HTML in Markdown cells and cell outputs should be sanitized.This
    should be set to True by nbviewer or similar tools.
    Default: False
    Equivalent to: [--HTMLExporter.sanitize_html]
--writer=<DottedObjectName>
    Writer class used to write the
                                results of the conversion
    Default: 'FilesWriter'
    Equivalent to: [--NbConvertApp.writer_class]
--post=<DottedOrNone>
    PostProcessor class used to write the
                                results of the conversion
    Default: ''

```

Equivalent to: [--NbConvertApp.postprocessor_class]
 --output=<Unicode>
 Overwrite base name use for output files.
 Supports pattern replacements '{notebook_name}'.
 Default: '{notebook_name}'
 Equivalent to: [--NbConvertApp.output_base]
 --output-dir=<Unicode>
 Directory to write output(s) to. Defaults
 to output to the directory of each notebook.
 To recover
 previous default behaviour (outputting to the
 current
 working directory) use . as the flag value.
 Default: ''
 Equivalent to: [--FilesWriter.build_directory]
 --reveal-prefix=<Unicode>
 The URL prefix for reveal.js (version 3.x).
 This defaults to the reveal CDN, but can be any url pointing to a
 copy
 of reveal.js.
 For speaker notes to work, this must be a relative path to a local
 copy of reveal.js: e.g., "reveal.js".
 If a relative path is given, it must be a subdirectory of the
 current directory (from which the server is run).
 See the usage documentation
 ([https://nbconvert.readthedocs.io/en/latest/usage.html#reveal-js-
 html-slideshow](https://nbconvert.readthedocs.io/en/latest/usage.html#reveal-js-html-slideshow))
 for more details.
 Default: ''
 Equivalent to: [--SlidesExporter.reveal_url_prefix]
 --nbformat=<Enum>
 The nbformat version to write.
 Use this to downgrade notebooks.
 Choices: any of [1, 2, 3, 4]
 Default: 4
 Equivalent to: [--NotebookExporter.nbformat_version]

Examples

The simplest way to use nbconvert is

```
> jupyter nbconvert mynotebook.ipynb --to html
```

Options include ['asciidoc', 'custom', 'html', 'latex', 'markdown',
 'notebook', 'pdf', 'python', 'qtpdf', 'qtpng', 'rst', 'script', 'slides',
 'webpdf'].

```
> jupyter nbconvert --to latex mynotebook.ipynb
```

Both HTML and LaTeX support multiple output templates. LaTeX

includes

```
'base', 'article' and 'report'. HTML includes 'basic', 'lab' and  
'classic'. You can specify the flavor of the format used.
```

```
> jupyter nbconvert --to html --template lab mynotebook.ipynb
```

You can also pipe the output to stdout, rather than a file

```
> jupyter nbconvert mynotebook.ipynb --stdout
```

PDF is generated via latex

```
> jupyter nbconvert mynotebook.ipynb --to pdf
```

You can get (and serve) a Reveal.js-powered slideshow

```
> jupyter nbconvert myslides.ipynb --to slides --post serve
```

Multiple notebooks can be given at the command line in a couple of different ways:

```
> jupyter nbconvert notebook*.ipynb
```

```
> jupyter nbconvert notebook1.ipynb notebook2.ipynb
```

or you can specify the notebooks list in a config file, containing::

```
c.NbConvertApp.notebooks = ["my_notebook.ipynb"]
```

```
> jupyter nbconvert --config mycfg.py
```

To see all available configurables, use `--help-all`.

```
[NbConvertApp] WARNING | pattern 'ESERCITAZIONE_DATABASE.ipynb' matched no files
```
